Your three revision areas

NBA Play Ranker | Supervisor walkthrough

This review covers the deployment model, risk plan and test plan. The current VP file excludes the earlier unpublished interaction-diagram edits.

1. Deployment model

Open Basketball Playtype Ranker in Visual Paradigm Desktop. Use the wss workspace and open Deployment Model2.0, then the populated Deployment Diagram.

Show	Explain
Layout	Follow each communication line between the devices and services. The paths should be easy to trace without crossing.
Protocol and port labels	The six network paths use HTTPS/TCP 443. The internal API server uses HTTP/TCP 8080. Explain which service receives each request.
Change scope	Revision 55 changes only the deployment diagram. All 191 other diagrams match the previous shared revision 54.

What to say

“I cleaned up the deployment layout so the connections are easier to follow. I added the protocol and port to each network connection. I also checked the labels against how the app is configured.”

Published revision

The deployment diagram is published in shared Teamwork revision 55. The native file in this handoff is the verified committed copy. It contains the corrected layout and protocol-port labels; the other 191 diagrams are unchanged.

Tracking: SCRUM-440 - Deployment Model Revision. The deployment preview and preservation checks are in deployment/.

Scope check

The previous interaction work is kept separately and is not part of this revision. Use the committed deployment-only file supplied with this handoff.

2. Risk management plan

Show the linked work and the reason for each risk update.

Open BSR-110. Show its description, mitigation, current status and Linked work items.

Linked work	What it shows
SCRUM-506 and SCRUM-524	The completed hosting and deployment work.
SCRUM-534	The planned cost review, backup and migration or rollback work if needed.

Then open BSR-78 to show a different example: missing shot fields and the work needed to repair the data. Point out that an unresolved problem stays open.

What to say

“I went through all 84 risks, updated the mitigation steps and linked each risk to the work needed to handle it. BSR-110 now links to the hosting work and the planned cost and migration review. The risks with unresolved problems are still open.”

Verified

All 84 risk cards have linked work items and specific reviews. There are 198 formal links. This covers the full risk register, not just the original 17 cards.

Files to use

risks/ contains the risk register, linked work and the latest audit. SCRUM-529 tracks the risk-plan revision.

If asked what happens next

Follow the linked work, update the affected risk when the fix is verified, and keep the cost and migration review current.

3. Test plan

Show the board, a new passing case and a new failing case.

Open the BST Kanban board. Use Group by Test Suite. Show the Verify, Testing In Progress, Pass and Fail columns. The cases are on the board.

Open	Show
BST-137	The Fall 2026 suite with 18 new cases created October 11. Suites are Epic-level; cases are Task-level.
BST-148 - Pass	The Gameplan persistence test: steps, expected result, observed result and feature link. A saved revision advanced from 1 to 2; a stale update changed no rows.
BST-140 - Fail	The first Gameplan Build used different context from the second Build. Show the observed result, then follow its linked fix SCRUM-539.

Current results

121 test cases: 101 Pass, 14 Fail and 6 Verify. Of the 18 new Fall cases, 8 Pass, 9 Fail and 1 Verify. All 14 failed cases link to planned fix tickets. Verify means the check is unfinished or blocked.

What to say

“I put the tests on the board, added 18 new Fall test cases and linked them to the features and use cases. I recorded the results and created linked fix tickets for the failures. The test plan now shows what works and what still needs fixing.”

What comes next

Fix the linked bugs and rerun the affected cases. Start with shot-data errors and the Gameplan context issues. Keep unfinished checks in Verify until they can be completed.

test-execution.txt and tests/ contain the detailed execution records. SCRUM-530 tracks the test-plan revision. The application fixes are separate planned work.

Submission

Use the native model, shared VP/Jira links and current evidence. Combine the group work, confirm professor access and the deadline, then submit through SLATE. No SLATE upload has been made. Jira worklogs total 9 hours: 4 for risks, 4 for tests and 1 for the deployment model.
