Assignment 1 Revision

NBA Play Ranker | Review and submission guide | 11 October 2026

This package covers the interaction model, risk management plan and test plan corrections. The architecture, deployment-diagram and project-timeline corrections remain with the other group member.

Feedback	Revision	Where to review
Inconsistent lifelines and unclear messages	Revised all 17 sequence diagrams. Lifelines use a named instance and classifier. Calls show typed parameters; replies identify their results. Filled the three empty Glossary sequences.	Visual Paradigm model and interaction evidence
Risk reviews and missing linked work	Reviewed all 84 risks. Updated ratings and statuses where evidence justified a change. Every risk now has linked mitigation work, including BSR-110.	BSR project and risk export
Tests left in backlog; limited coverage	Moved suites onto the Kanban board and saved grouping by Test Case. Added 18 Fall 2026 cases with use-case references, feature links and expected results.	BST-137 and test coverage export
Missing execution and bug tracking	Recorded current results and linked failures to planned fixes. Updated existing cases using the checks that actually ran.	BST case comments and SCRUM-538 through 550

What changed in the model

The revision starts from shared Visual Paradigm revision 54 and preserves all 192 original diagrams and their existing identities. It also retains the newer team diagrams for NLP, data quality and export contracts. The native file is saved. Publication to the shared online model still needs the Desktop Team > Commit step.

The diagrams distinguish working library code from future page integration. They also reflect the protected role lookup and the current authenticated export route. The native model is included; image previews are only a reading aid.

Main work items: SCRUM-528 - interaction model; SCRUM-529 - risk review; SCRUM-530 - test plan.

What the tests show

The application has working features and confirmed problems. Passing unit tests do not mean every browser workflow works.

Check	Current result
New Fall 2026 Jira cases	8 Pass, 9 Fail, 1 Verify. The Verify case retains the earlier shot-metrics timeout and needs a retest after its fix.
Additional existing cases	An additional 15-case review found 7 Pass and 5 Fail. One timing case needs an agreed target; two shot-model evaluations await repaired data.
Local test run	202 backend and fixture-safety checks passed; 34 frontend checks passed; TypeScript passed. Four known shot-data failures were reproduced separately.
Production API and database	106 scoped assertions passed. Both transactional database verification suites passed and removed their test fixtures.
Shared GitHub CI	Backend tests and the frontend tests/build passed for the regression-test commit. Known failure markers remain visible in the test results.

Planned fixes

Ticket	Problem to fix
SCRUM-538, 548, 549	Repair shot-team and margin data, report unmapped columns and define when prediction inputs are available.
SCRUM-539, 540, 541	Use fresh context on the first Gameplan Build, forward supported coaching flags and preserve overtime.
SCRUM-542, 543	Finish Model Metrics loading and serve saved shot metrics without training during a page request.
SCRUM-544	Make analyst shot-page access agree with the API role policy.
SCRUM-545	Render Shot Statistical Analysis using the current API response fields.
SCRUM-546	Say when baseline explanations do not use game context.
SCRUM-547	Define readiness and report missing startup prerequisites clearly.
SCRUM-550	Agree and measure a deployed Top-K timing target. Two of eight requests took about 33 seconds.

Repair the shot dataset before relying on shot recommendations. The separate play-type dataset is not implicated by the shot-team checks. Current PPP calibration is a retrospective diagnostic; it does not establish future-game forecasting accuracy.

These are planned fixes, not completed repairs. Cases without a current execution remain Verify. The later Gameplan frontend migration also remains separate work.

How to review this revision

1. Open the Visual Paradigm snapshot

Open the .vpp file in the model folder. Compare an authentication sequence, the calibration sequence and the Glossary sequences. Check instance/classifier names, call parameters and return labels. Use the interaction evidence folder for the diagram index and preservation checks.

2. Check the Jira risks

Open BSR-110 and expand Linked work items. Its hosting and migration work is now linked. Review other risk cards for a current probability, impact, mitigation and a short explanation of the status.

3. Check the Jira tests

Open the test board and find BST-137. Each new case lists steps and an expected result. Open a failed case to see the result and its linked fix. The test evidence folder separates local checks from production and browser observations.

4. Review the shared repository

Use the team GitHub repository for commits, model evidence and current source. The source snapshot is commit 9804b32, whose tests and production build passed in shared CI. The risk, model and test evidence are recorded separately on main. No application deployment is part of this revision.

5. Prepare the group submission

Combine this revision with the other group member's architecture, deployment and timeline corrections. The assignment requires a native Visual Paradigm snapshot in SLATE, the shared Visual Paradigm Online model, and the Jira site link with professor access to all three projects.

Jira site: basketball-strategy.atlassian.net
Visual Paradigm: shared Basketball Playtype Ranker workspace

The Jira, test-planning and interaction-design lessons from SLATE were checked. Confirm the submission deadline and professor access. Individual work logs require your actual effort totals. No SLATE upload has been made.

Package contents

model/ contains the native snapshot. evidence/ contains the diagram, risk and test records. source/ contains the shared application source. The pinned restore-shot-data.py script is at the top of the ZIP. The large shot dataset is externalized to keep this ZIP below 20 MB; restoring it does not repair its known data defect. No account passwords or environment secrets are included.
